

SETTING UP NETWORK IN WINDOWS 7

STEP 1

1. Open **Network and Sharing Center (NETVÆRKS- OG DELINGSCENTER)**, which can be found in the start menu and the Control Panel.
2. Select **Change adapter settings (REDIGER INDSTILLINGER FOR NETVÆRKS KORT)** as shown in Figure 1

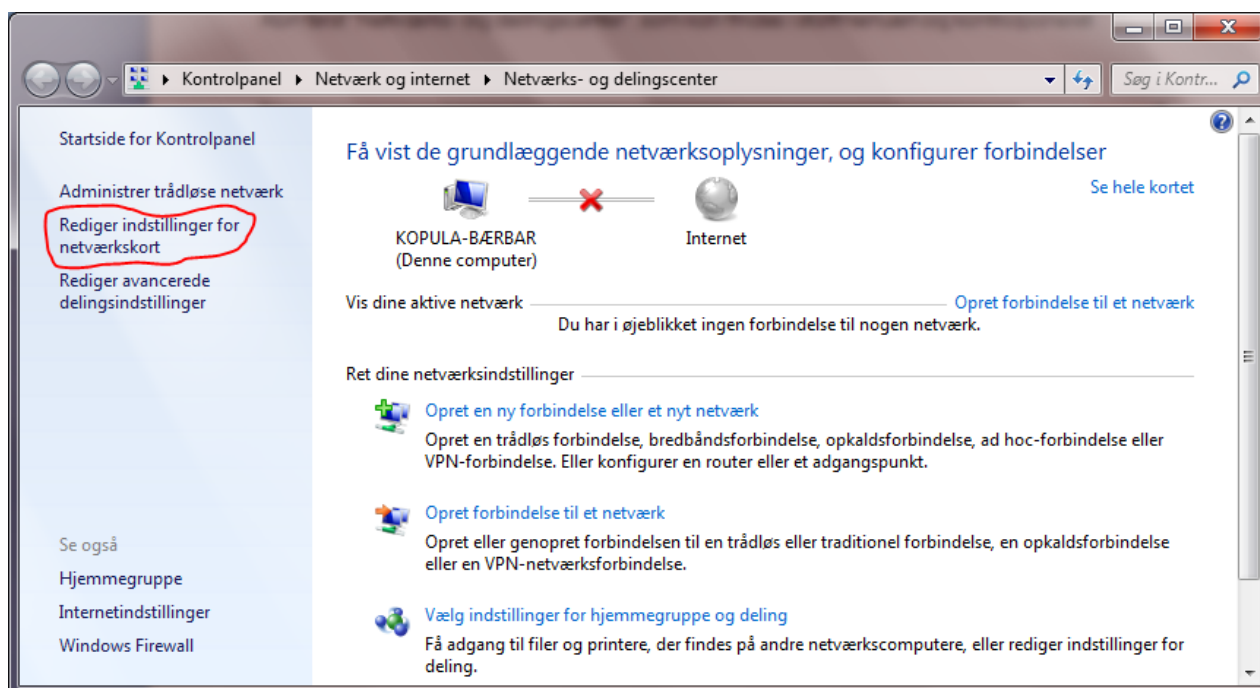

Figure 1

STEP 2

1. Find the network connection your ethernet cable is plugged into. Usually, it will be the only connection with the icon as shown in figure 2.
2. Open settings for the network connection by double clicking the icon or by right-clicking it and selecting **Properties (EGENSKABER)**.

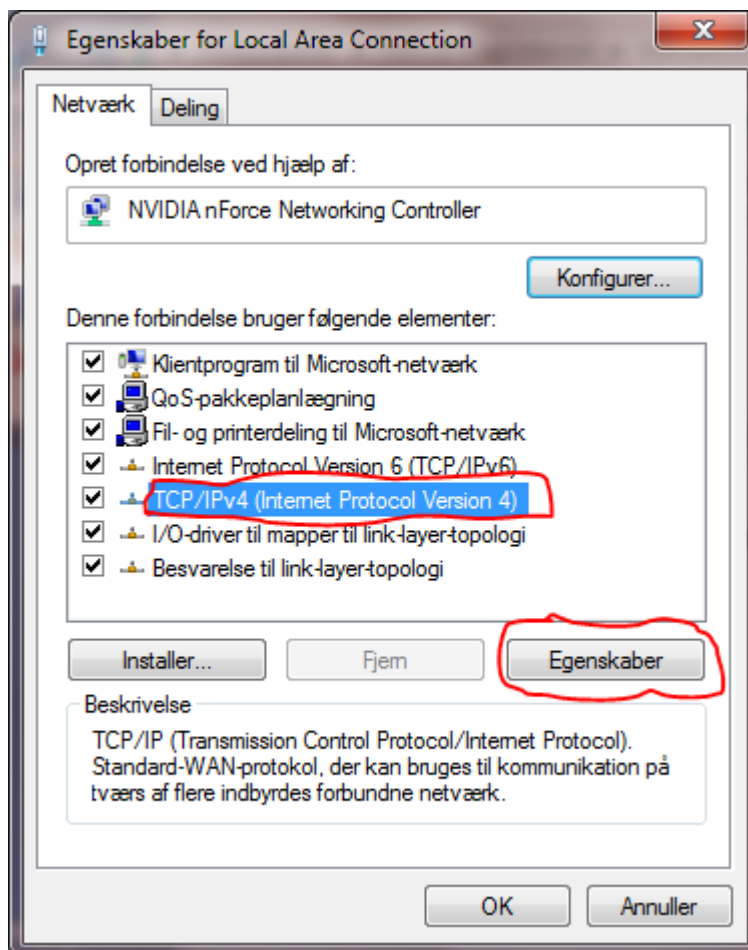

Figure 2

STEP 3

1. Find **TCP/IPV4 (INTERNET PROTOCOL VERSION 4)** and select it.
2. Select **Properties (EGENSKABER)**.

**Figure 3**

STEP 4

1. Select **Obtain an IP address automatically** (HENT AUTOMATISK EN IP-ADRESSE).
2. Select **Obtain DNS server address automatically** (HENT AUTOMATISK EN DNS-SERVERADRESSE). Though, it is an advantage to use alternative DNS-services (like OpenDNS) as it can provide more stability for the internet connection. The alternative DNS-setup is shown in Figure 4.
3. Click **OK**.
